

VICTOR NWACHUKWU

Software Engineer · Backend & Product Systems

Nigeria · Remote / Global | storm@beyndtech.com | +234 808 694 1101 | storm.beyndtech.com | github.com/storm-beyndtech

SUMMARY

Software engineer working across TypeScript, Go, React/Next.js, APIs, data systems, and production product infrastructure. Built and operate Rugburn, a live behavioral-intelligence system with 32K+ forensic scans, while shipping backend, real-time, and product systems across crypto, social, commerce, and education products. Strongest in ambiguous systems where correctness, state, and operational failure modes matter.

TECHNICAL CORE

Languages: TypeScript, Go, SQL, JavaScript

Backend / Data: Node.js, NestJS, Express, PostgreSQL, MongoDB, REST APIs, WebSockets, real-time and batch pipelines

Frontend / Product: React, Next.js 16, Tailwind CSS, responsive systems, design systems, complex product UX

Applied / Infra: MCP, agent workflows, blockchain/RPC data integrations, Docker, CI/CD, testing, GitHub

EXPERIENCE

Founder & Lead Engineer | Rugburn (Beyndtech Arc Ltd)

2025–Present

- Built a production behavioral-intelligence platform spanning a Go scan worker, TypeScript/Next.js product surfaces, PostgreSQL evidence storage, public APIs, MCP tooling, and messaging bots.
- Processed 32K+ forensic scans; designed attribution, funding-relationship analysis, and evidence pipelines for noisy, adversarial on-chain data.
- Rebuilt the risk methodology after calibration exposed failure in the initial structural model, shifting toward behavioral evidence, explicit confidence, and degraded-state handling.
- Designed evidence-first casefile and bulletin workflows so assessments remain inspectable over time instead of collapsing into opaque scores.

Founding Product Lead / Product Engineer | Nakupenda

12/2025–Present

- Own product and frontend systems for a public-beta social platform with hundreds of active users, modeling complex messaging, live-room, governance, publishing, and monetization states.
- Ship Next.js 16 / React 19 product surfaces with real-time interaction, responsive UX, and shared design-system constraints.

Technical Instructor & Software Engineer | Pearlcity Hub

2024–2025

- Built production web applications on a TypeScript/React/Node stack and taught full-stack engineering through deployable, end-to-end projects.

Software Engineer | Spyder Dev (Freelance)

2021–2023

- Delivered frontend and backend features for client software, primarily a healthcare platform, on TypeScript-based stacks.

OPEN SOURCE & ECOSYSTEM

- Stellar ecosystem contributor - merged backend work covering transaction idempotency and SEP-6 anchor-response validation/reconciliation; also shipped merged real-time escrow event infrastructure to Trustless-OSS.
- Built the open-source Solana Risk & Compliance Intelligence skill with reproducible mainnet workflows and QuickNode x402 for keyless agent access; received QuickNode startup credits.
- Superteam Agentic Grant recipient for Augur, Rugburn's pre-outcome assessment and verification layer.
- 2x 4th place, BirdEye On-Chain Intelligence Hackathon; published technical writing on token manipulation and the June 2026 Raydium AMM exploit.
- Paid product-design engagement for Trustless Work via GrantFox, delivering an end-to-end Figma flow.

SELECTED SYSTEMS

VØID (VOID) | Risk-aware route decision infrastructure

In development

- Designing a Go/TypeScript decision layer that evaluates payment-route candidates across cost, reliability, latency, policy, and risk, with explicit provenance and fallback reasoning.
- Treats route selection as a decision-quality problem rather than a cheapest-path lookup; recommendation and execution remain deliberately separated.

Dash NG Shop | Real-time commerce operations

- Built multi-role commerce workflows coordinating inventory, orders, staff activity, payment state, and real-time operational updates.
- Designed around one operational truth across customer, storekeeper, sales, and admin views instead of refresh-driven state discovery.

Rasman | Music commerce / media entitlement

- Built direct-to-fan media commerce flows across catalog, authentication, playback, purchase, entitlement, download, and artist administration.
- Connected persistent playback state with paid-access and creator-management workflows across the product lifecycle.

ADDITIONAL PROJECT

SangoLabs - Nigerian-language data pipeline (Yoruba, Igbo, Hausa, Pidgin) with inter-annotator agreement scoring; Go backend and Next.js frontend.
